## Introduction

The *Acta* importer for Spotlight allows Mac OS X 10.4 ("Tiger") to index and rapidly search *Acta* documents.

Installation

Drag the importer to one of two folders:

`~/Library/Spotlight` to make it available to you ("~" is your home directory)

`/Library/Spotlight` to make it available to all users

Acta.mdimporter

What is Acta?

Acta is an outline processor. It lets you organize just about anything — reports, ideas, lists, projects, graphics — in the form of an outline, where topics have subtopics.

You can download a free copy of the latest version at http://a-sharp.com/acta/.

Acta requires you to run Classic (you may need to install this separately). Because of this, it won't run on an Intel-based Macintosh. We are however working on an outliner that will run on all Macs running "Tiger."

Support

While we don't formally support *Acta* or the *Acta* importer, we'd like to make sure it's working well on all systems. Feel free to contact us at acta2003@a-sharp.com with any comments.

Release Notes

9 Apr 06   1.1   Universal build.
30 Apr 05   1.0   Original release.
