1 XL Convert Summary

XL Convert is a simple to use utility for unit conversion in MS Excel. XL Convert consists of two parts (or files) the main MS Excel add-in (XLconvert.xla) and the unit database, unitdb.xls. Using this approach allows users to completely customize the units available to convert. This becomes especially convenient in specialized industries that have units not common to the mainstream. Engineers, scientists and many others have found XL Convert to be extremely easy to use and best of all, flexible.

2 Installation of XL Convert

2.1 Microsoft Office 2003 and Office XP Users

Be sure to uninstall any previous versions of XL Convert prior to proceeding (see Section 3). Create a temporary file folder on your hard drive in a convenient location. You may delete this folder once the installation is complete. Unzip the contents of the folder XLConvertV1.1.zip to this temporary location. Double click the *XLConvertSetup.msi* file to begin installation. Follow the prompts on screen until the installation completes. Start Microsoft Excel. From the Tools menu, select Add-ins. Click the 'Browse' button to locate "C:\Program Files\SFSW\XLConvert\XLConvert.xla" (or the location you selected during installation if different) and click 'OK'. The XL Convert file is now listed in the dialog box. Check the check box next to XL Convert and

click 'OK' to dismiss the dialog. You should now see XL Convert start up and locate a single button on the toolbar at the top of the Excel Window.

3 Uninstalling XL Convert

To uninstall XL Convert go to Control Panel > Add/Remove Programs. Find the section for XL Convert and click 'Remove'. Once removed, upon starting Microsoft Excel, you will receive an error indicating that Excel cannot find 'Xlconvert.xla' (assuming you have the add-in loaded and selected to startup). To remove this file from the search list, go to Excel's menu Tools > Add-ins and select XL Convert. You will receive a message stating that the file is not found and asking if you wish to remove it from the list, click 'Yes'.

4 Running XL Convert

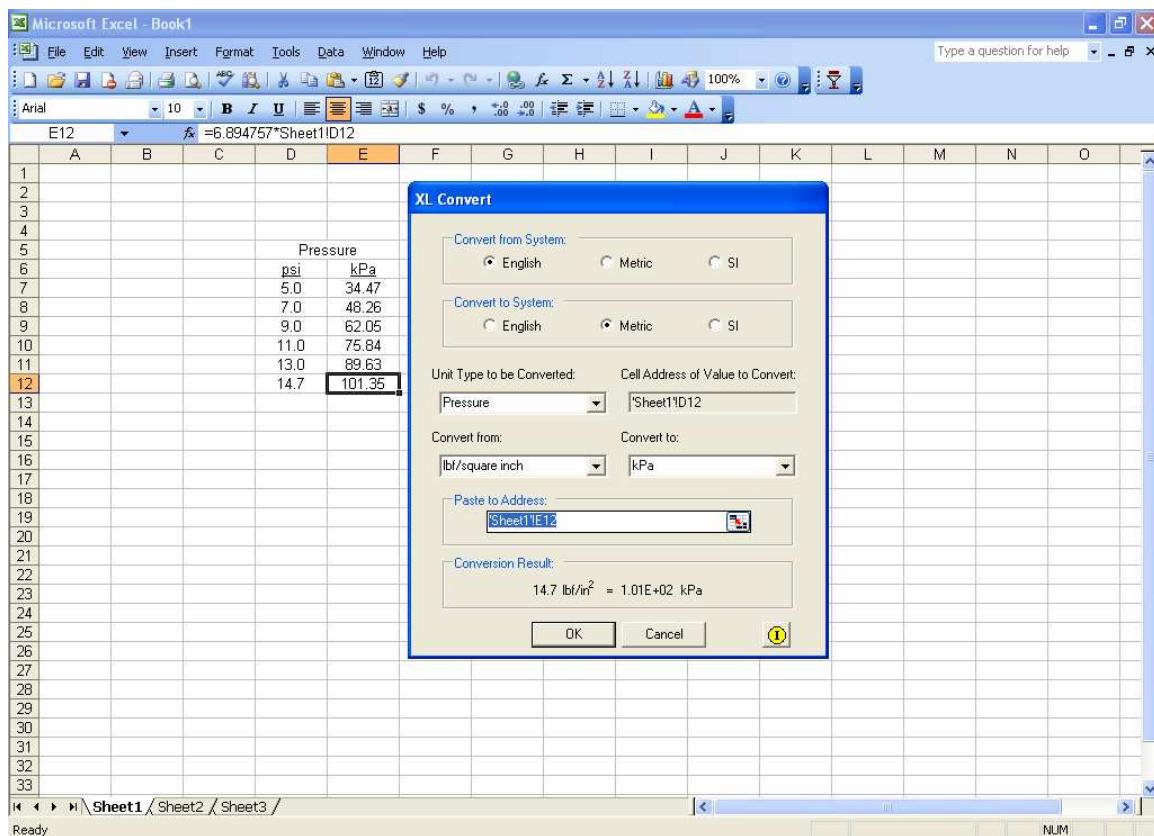

To start XL Convert simply select a cell containing a numeric value that you wish to convert. Click the XL Convert Button image and the main convert form is displayed. Then follow these simple steps:

1. Select the system that the value is currently in, English, Metric or SI.
2. Next select the system that the value shall be converted to.
3. Select the type of unit to be converted
4. Select the units of the current value
5. Select the units to convert to.

The result is displayed in the form's result box with appropriate units. Select 'OK' to dismiss the form.

4.1 Paste value to Worksheet

If you wish, you may paste this value to any cell in the current workbook by clicking the 'Paste To Address' button. The form will shrink and allow you to select your destination cell. Once selected you then click the down arrow to restore the form and the 'Paste To Address' is now highlighted. Click 'OK' and the value is pasted to the destination. It's that simple!

4.2 Using Temperature Units

Since temperature conversion is not a simple linear transform, XL Convert converts the value selected in the 'Value to Convert Box' to the equivalent

value in the selected 'Unit To Box' with no reference to the original cell address. If the value converted is pasted to the sheet, only the converted value is pasted, and not (as in all other cases) a conversion factor multiplied by the original cell address. Therefore, the usual drag and copy function in Excel will not work for Temperature conversions.

5 Customizing Units

XL Convert allows users to add and/or delete any units they wish. The program works by maintaining an Excel database (unitdb.xls) in the sub directory "unit_database". Opening this file reveals two WorkSheets (UnitDB and OriginalDB_Backup). The UnitDB WorkSheet is the main database that XL Convert uses upon startup. The OriginalDB_Backup is a duplicate copy of the original data that comes with the package. If for any reason the UnitDB WorkSheet becomes destroyed, erased or corrupted, the original state may be returned by simply selecting the entire data table in OriginalDB_Backup and transferring this data back to the UnitDB WorkSheet.

5.1 Database Description

The UnitDB WorkSheet contains the following columns: SYSTEM, UNIT_TYPE, UNIT_NAME, UNIT_CONV_VALUE, and UNIT_TAG. Each of columns is described below.

5.1.1 SYSTEM

XL Convert uses three unit system types, English, Metric and SI. Each UNIT_TYPE must have a single SI entry and at least one English or Metric equivalent. There is no limit to the amount of English or Metric equivalents you can use of each UNIT_TYPE (Excel does have a limit of rows at over 65,000 so for all practical purposes, it is limitless)

5.1.2 UNIT_TYPE

The UNIT_TYPE is the general type of unit, i.e. Length, Acceleration, etc. As stated above, each UNIT_TYPE must have a single SI entry and at least one entry in either English or Metric.

5.1.3 UNIT_NAME

UNIT_NAME is the common or user defined name you will apply to the unit, i.e. feet, meters, etc.

5.1.4 UNIT_CONV_VALUE

This value is critical to XL Convert as it is used as the basis for the conversions. The value is the quantity required to convert a specified unit to the equivalent SI unit. For example, the SI unit for Length is meter. The UNIT_CONV_VALUE for the SI unit meter is 1.00. In other words, 'x' meters times 1.00 = 'x' meters. For the English unit inch, the UNIT_CONV_VALUE is 0.0254 since 1 inch = 0.0254 meters. The general equation is thus;

$$[\text{value in SYSTEM}] * [\text{UNIT_CONV_VALUE}] = [\text{equivalent value in SI SYSTEM}]$$

5.1.5UNIT_TAG

The UNIT_TAG values are simply the unit's shorthand for the associated UNIT_NAME. For example, meters have a UNIT_TAG of 'm'. The UNIT_TAG is for display purposes only and does not change the resulting conversion values, however, it MUST BE supplied. For squared or cubed values, insert the symbols ² or ³.

5.2 Adding User Defined Unit Types

Adding user defined unit conversions is quite simple; however there are several rules that need to be adhered to. To help clarify these rules, open the unitdb.xls file and examine the UnitDB WorkSheet.

1. For each entry, every column must have a value. Do not omit any of the database headings listed above
2. For each new UNIT_TYPE. The UNIT_TYPE must have a single SI equivalent. This SI value MUST be the first entry in the table for the new UNIT_TYPE. Each new UNIT_TYPE must have at least one equivalent unit in SYSTEM English or Metric.
3. No blank rows are allowed. If a blank row is encountered, the values below the blank row will not be read into XL Convert.
4. All SYSTEM entries of the same system must be grouped. For convention, the SI unit is listed first, then the English units and finally the Metric units. If the units are mixed values below the SI unit, SYSTEM values will not be read for that UNIT_TYPE.
5. New UNIT_TYPE entries shall be placed at the bottom of the table. Adhering to this rule will keep your user-defined units easy to

maintain. This will also minimize any disturbance to the database reading module in XL Convert.

Once all entries are made, save unitdb.xls and exit MS Excel. Upon restarting MS Excel and XL Convert, the new values will appear in the XL Convert program.

5.3 Adding values to the Original Database

If you wish, you may add entries to the original database on WorkSheet UnitDB. To do this select where in the table you wish to add your new unit. Select that row and 'Insert Row' from the Excel Insert Menu. Enter the SYSTEM, UNIT_TYPE, UNIT_NAME, UNIT_CONV_VALUE and UNIT_TAG for that unit. For example, suppose you wished the database to include the length unit 'decameter'. 1 decameter is equal to 10 meters so you would need to add:

SYSTEM: Metric

UNIT_TYPE: Length

UNIT_NAME: decameter

UNIT_CONV_VALUE: 10

UNIT_TAG: dm

Once all entries are made, save unitdb.xls and exit MS Excel. Upon restarting MS Excel and XL Convert, the new values will appear in the XL Convert program.

6 Registration

In order to eliminate the nag screen upon start up, a registration code may be purchased at www.seaflowersoftware.com for \$5.00 (USD). Once purchased, the code should be entered during startup of XL Convert. During the startup, the nag screen will appear with a button 'Enter Registration Code'. Click this button and a text box will appear, enter the registration code in this box and click 'OK'. Upon successful entry of the code, the nag screen will no longer appear on startup. Thank you for your support!

7 Reference

All unit conversions in XL Convert have been taken from the following publication:

Standard Practice for Use of the SI International System of Units, The Modernized Metric System. ASTM E 380-92, Published by ASTM, Philadelphia, PA 1993.

8 Support

If you have any problems installing or using XL Convert check the FAQ's section of Seaflower Software's web site at www.seaflowersoftware.com/index_files/Page320.htm. If your issue cannot be resolved by checking here, please contact customer support at support@seaflowersoftware.com and document your issue.

9 Units

The following table contains all the units available for conversion in XL Convert (full edition).

Unit System	Unit Type	Unit
SI	Acceleration	meter/second squared
English	Acceleration	inch/second squared
English	Acceleration	feet/second squared
Metric	Acceleration	gal
Metric	Acceleration	free fall, g
SI	Angle	radian
English	Angle	second
English	Angle	minute
English	Angle	grade
English	Angle	degree
Metric	Angle	second
Metric	Angle	minute
